The PDB database

First let's see what is in the PDB database, the main repository of protein structures.

Downloaded composition stats from: https://www.rcsb.org/stats/summary

For context: Release 2023_2024 of 13-Sep-2023 of UniProtKB/TrEMBL contains 251600768 sequence entries.

There is a problem here due to the commas in the numbers. This causes R to treat them as characters.

```
x <- stats$X.ray

```
rm.comma(stats$EM)
```

```

I can use apply() to fix the whole table...

```

Here is a lovely figure of HIP-Pr with the catalytic ASP residues, the MK1 compund and the all important water 308

Q4: Water molecules normally have 3 atoms. Why do we see just one atom per water molecule in this structure?

The resolution can't see the small hydrogen atoms because the size is so small.

Q5: There is a critical "conserved" water molecule in the binding site. Can you identify this water molecule? What residue number does this water molecule have?

HOH 308

Q6: Generate and save a figure clearly showing the two distinct chains of HIV-protease along with the ligand. You might also consider showing the catalytic residues ASP 25 in each chain and the critical water (we recommend "Ball & Stick" for these side-chains). Add this figure to your Quarto document.

#4. Comparative structure analysis of Adenylate Kinase

We need some packages for today's class. These include 'bio3d' and 'msa'.

We 'msa' package is from BioConductor. These packages focus on genomics type work and are managed by the 'BiocManager' package.

Install 'install.packages("BiocManager")' and then 'BiocManager::install("msa")' all entered in the R "brain" console.

Q10. Which of the packages above is found only on BioConductor and not CRAN?

msa

Q11. Which of the above packages is not found on BioConductor or CRAN?:

bio3d-view

Q12. True or False? Functions from the devtools package can be used to install packages from GitHub and BitBucket?

True

```

Call:
  pdbaln(files = files, fit = TRUE, exefile = "msa")

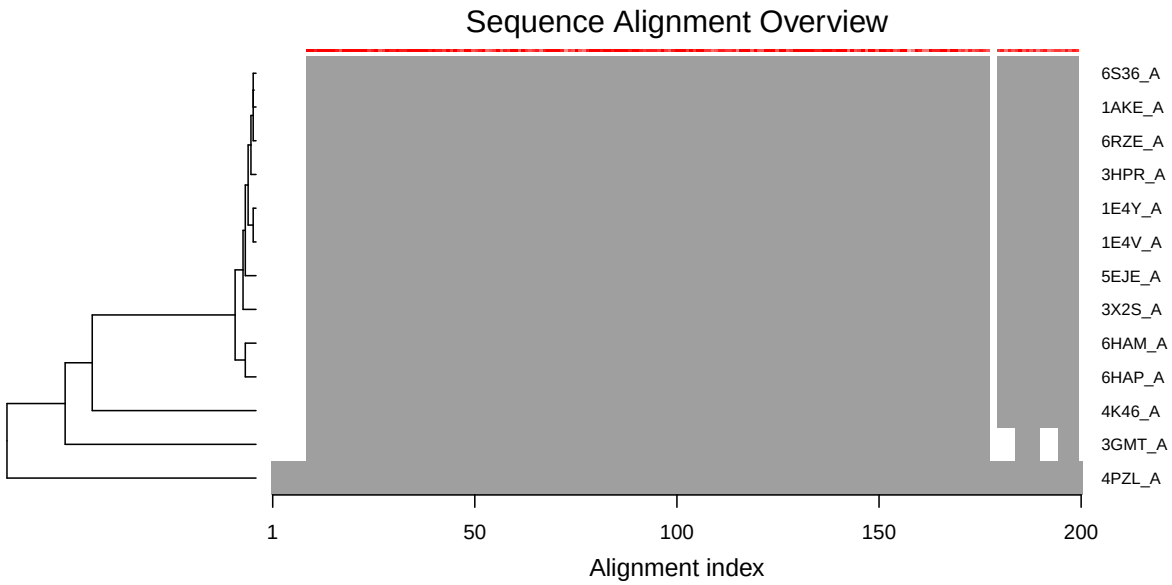
Class:
  pdbs, fasta

Alignment dimensions:
  13 sequence rows; 227 position columns (204 non-gap, 23 gap)

+ attr: xyz, resno, b, chain, id, ali, resid, sse, call
```

```
# Vector containing PDB codes for figure axis
ids <- basename.pdb(pdbs$id)

# Draw schematic alignment
plot(pdbs, labels=ids)
```



Now I can search the PDB database for related sequences:

Side-note: Let's annotate these structures(in other words find out what they are, what species they are from, stuff about the experiment they were solved in etc.)

For this we can use the 'pdb.annotate()'

```
#anno <-pdb.annotate(hits$pdb.id)
anno <- pdb.annotate(ids)
unique(anno$source)
```
